

ABSTRACT

An inorganic particles-containing additive composition is disclosed which contains a polyvalent metal, a phosphoric acid ion, an organic acid having a carboxyl group and an alkali metal, said composition satisfying the following requirements of (a) and (b):

$$(a) \quad 70 \leq X \leq 90000$$

X: Amount (mg/Kg) of the alkali metal contained in a solid content of the additive composition,

$$(b) \quad 0.1 \leq Y \leq 15$$

Y: Electric conductivity (mS/cm) when the additive composition is adjusted to a solid concentration of 10 % by weight.

The additive composition is excellent not only in dispersibility and storage stability in a liquid, but also in flavor.
